## ACKNOWLEDGMENTS

Appreciation is expressed to the cooperators that provided their land, equipment and time in assisting with prepping, planting, managing and harvesting of these plots throughout the year. All cooperators are listed in Table 1. In addition, we would like to extend our appreciation to **Cotton Incorporated** through the **Texas State Support Committee** for their partial funding of these trials.

## 2013 HIGHLIGHTS

Variety selection is the most important decision made during the year. Unlike herbicide or insecticide decisions that can be changed during the season to address specific conditions and pests, variety selection is made only once, and variety selection dictates the management of a field for the entire season. Variety decisions should be based on genetics first and transgenic technology second. Attention should be focused on agronomic characteristics such as yield, maturity, and fiber quality when selecting varieties. Figure 1 illustrates the cotton production regions of Texas.

From the latest data available, transgenic varieties accounted for 99% of the state acreage again in 2013. According to the USDA-Agricultural Marketing Service “Cotton Varieties Planted 2013 Crop” survey, the estimated percentage of upland cotton planted to specific Brands in Texas are as follows, Alltex had 2.5%, Americot/NexGen had 20%, Bayer CropScience – FiberMax had 39%, Bayer CropScience – Stoneville had 2.5%, Croplan Genetics had 0.5%, Delta Pine had 16%, Dyna-Grow had 1.4%, and Phytogen had 7%.

To assist Texas cotton producers in remaining competitive in the Lower Rio Grande Valley, Blacklands, South Texas/Wintergarden and Upper Coastal Bend regions (Figure 2), the Texas A&M AgriLife Extension Service-Cotton Agronomy program has been conducting, large plot, on-farm, replicated variety trials for the past eight years. This approach provides a good foundation of information that can be utilized to assist the variety selection process.

Twenty Replicated Agronomic Cotton Evaluation (RACE) Trials were planted in 2013 and are listed in Table 1. The 2013 season began with extremely dry to adequate soil moisture profile levels in most regions of the state at the time of planting. Some areas, mainly in the Lower Rio Grande Valley (LRGV) and Lower Gulf Coast (LGC) regions had very low soil moisture levels and numerous planned trials were not planted as a result of insufficient moisture to germinate the seed following planting. Even in regions

with sufficient planting moisture, obtaining an adequate stand was a challenge due to a string of several cold and wet weather events in the spring in the spring. As a result, many producers needed to replant multiple times and delayed planting for others.

The locations that were able to get a stand up and growing, generally made a decent crop considering the abnormally dry conditions that persisted throughout most regions of the state in 2013 and which has been preceded in several drier than normal years. Then, beginning in late September of 2013 following most of the cotton harvest, most regions of the state started to receive more typical levels of rainfall.

Mean location yields ranged from 2207 lbs/ac for the Weslaco irrigated location to 686 lbs/ac for the Nueces Co location. Mean dryland location yields ranged from 1392 lbs/ac for Milam Co to 738 for the Dewitt Co.

All the cotton seed companies with RoundupFlex® or Glytol® and Bt2® or Widestrike® technology had the opportunity to include at least one variety in the RACE trial at each location. All varieties were treated with either Aeris or Avicta Complete Pak seed treatment. Included in this publication are the cotton variety descriptions provided by company. See descriptions on page 1 -1 .

In addition to the RACE trials, two Monster cotton variety trials (Table 22 and 23) were conducted in 2013 and the final yields and grades. Table 1 provides a list of cooperators, planting and harvest dates, row spacing and plot area for each location. Tables 2-5 show numerical rankings based upon lint yield for the varieties across all locations within a production region. Only the varieties that were planted at a minimum of three locations for the Lower Rio Grande Valley (Table 2) and Coastal Bend Counties (Table 3), seven locations for the Upper Coastal Bend (Table 4), and three locations for the Central Texas Blacklands County locations (Table 5) were included in these four tables.

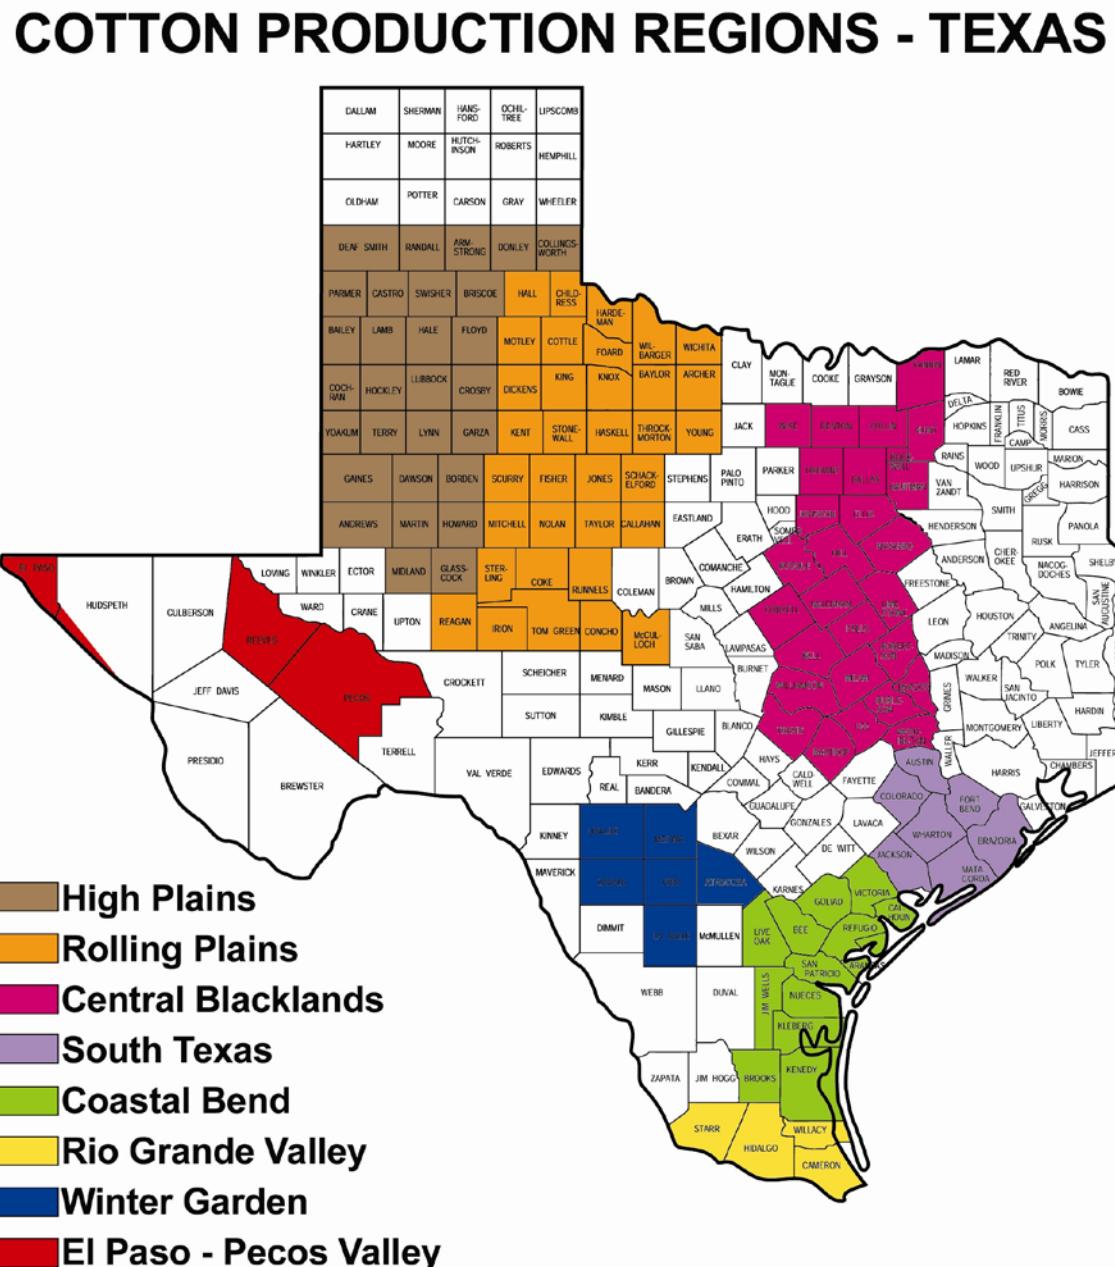

Tables 6 to 23 include the RACE trial yield data and fiber analysis for each individual location. Data featured in these tables include, statistical analysis of yield, turnout, fiber quality parameters, loan and gross lint value/acre. Most locations were ginned with a 20-saw table-top gin with no lint cleaner. This method consistently produces higher lint turnout percentages than would be common in a commercial gin. Consequently, higher turnouts equate to lint yields which are generally higher than area-wide commercial yields. Additionally, all data were standardized to a color grade and leaf of 41-4.

The statistical analysis quantifies the variability of the test site conditions, such as soil type, harvesting, insect damage, etc. A CV (coefficient of variation) of 15% or less is

generally considered acceptable and means the data are dependable. A trial with a small LSD (least significant difference), indicates more consistency within the trial and higher likelihood of identifying differences among varieties. A trial location with a large LSD and large CV indicates a higher degree of variability at the trial location. Non-statistical significance is represented as “NS” and indicates no differences among the varieties within the data column at a 5% significance level.

Varieties that are statistically different from one another will not have the same letter next to the corresponding number value in a column. For example, Table 6 (Uniform Stacked-Gene Cotton Variety Trial in Cameron county) lint yields for PHY 575WRF (1638 lbs of lint/acre) and NG 1511B2RF (1622 lbs of lint/acre) are both followed by a letter, “b”, and thus are considered significantly similar for yield. However, DP 1252 B2RF (1800 lbs of lint/acre) and NG 1511 B2RF (1622 lbs of lint/acre) do not have the same letter following each of them and are therefore considered significantly different from one another.

Figure 1. Cotton Production Regions of Texas

## **Variety Characteristics/Highlights**

Below are the cotton variety characteristics and highlights that were included in the 2013 Uniform Variety Trials and other common varieties planted in these regions. These cotton variety descriptions were provided by individual seed company representatives or publicly available information.

### **ALLTEX NITRO 44B2F**

- Semi-smooth leaf
- Excellent seedling vigor
- Medium maturity
- Superior fiber quality with very long staple
- Premium micronaire in high micronaire conditions
- Adapted to irrigated South Texas, Texas High Plains and Concho Valley

### **DynaGro 13125B2F (experimental DynaGro cultivar)**

- Semi-smooth leaf
- Medium maturity
- Good fiber quality and turnout
- Adapted to Lower Rio Grande Valley and Southeastern US

### **CROPLAN GENETICS 3787B2F**

- Mid-full maturity
- Adapted for dryland but produces good under irrigated conditions
- Excellent seedling vigor
- Very good storm tolerance
- Excellent fiber package

### **DeltaPine 0935B2RF**

- Mid maturity variety
- Smooth leaf
- High gin turnout
- Nectariless trait for plant bug suppression

### **DeltaPine 0949B2RF**

- Medium-tall plant height
- Mid-full maturity variety
- Light-hairy leaf
- High gin turnout

### **DeltaPine 1044B2RF**

- Mid-full maturity
- Semi-smooth leaf
- Excellent fit on dryland and limited irrigation
- V good Verticillium and Bacterial Blight resistance

### DeltaPine 1048B2RF

- Medium-tall plant height
- Mid-full maturity
- Semi-smooth leaf
- Offers improved staple and uniformity
- Good Bacterial Blight and moderate Verticillium resistance

### DeltaPine 1219B2RF

- Medium-tall plant height
- Early maturity variety
- Semi-smooth leaf
- Broadly adapted across Texas
- Good combination of yield and fiber quality

### DeltaPine 1252B2RF

- Medium-tall plant height
- Smooth leaf
- Great fit for irrigated and more productive full season environments

### DeltaPine 1359B2RF

- Smooth Leaf
- Full- season maturity
- Aggressive growth habits, requiring aggressive PGR management, especially pre-bloom
- Responsive to high-yield environments with high yield potential

### FiberMax 1740B2RF

- Early/medium maturity variety
- Medium-tall plant with a slightly bushy growth habit
- Benefits from early season PRG applications
- Features good fiber properties
- Well-adapted to all cotton growing areas
- 

### FiberMax 1944 GLB2

- GlyTol® + LibertyLink® and Bollgard II® technology
- Early-medium maturity....more towards medium maturity
- Widely adapted across entire Cotton Belt – irrigated or dryland
- Well suited for limited irrigation

### FiberMax 2989GLB2

- Medium maturity variety
- Smooth leaf
- Medium-tall plant with a slightly bushy growth habit
- Benefits from early season PRG applications
- Features good fiber properties
- Well-adapted to all cotton growing areas

### FiberMax 8270GLB2

- GlyTol® + LibertyLink® and Bollgard II® technology
- Medium to full maturity
- Okra leaf variety
- Especially well-suited for Coastal Bend dryland production

### NexGen 1511B2RF

- Medium maturity
- Semi-smooth leaf
- Excellent seedling vigor
- Medium to Tall plant height
- Moderate to aggressive plant growth regulation may be necessary, especially prior to first bloom, on highly productive soils
- Broad adaptation across soil types, geographies, and production systems
- Well adapted to irrigated or dryland throughout all areas of Texas
- High turnout and very good fiber quality

### NexGen 1511B2RF

- Full season maturity
- Indeterminate fruiting habit
- Smooth leaf
- Tall plant height
- Adapted to irrigated and dryland areas of south/central Texas, south delta, southeast and Arizona
- Moderate to aggressive plant growth regulation may be needed on productive soils
- High turnout and very good fiber quality

### PhytoGen 339WRF

- Indeterminate, very early maturing
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor

### Phylogen 367WRF

- Indeterminate,
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor
- Root Knot Nematode resistance

### Phylogen 375WRF

- Indeterminate, often early maturing
- Semi-smooth leaf
- Medium-tall plant height
- Excellent seedling vigor
- Has atypical high degree of yield stability and quality for an early maturing cotton

### Phylogen 499 WRF

- Mid-maturity variety with exceptional yield potential and very high turnout
- Aggressive growth, greater than PHY 375 WRF
- Consistent across soils and environments, suited for dryland and irrigated fields
- Outstanding seedling vigor and early season growth
- Larger seed size ~ 4,000 – 4,200 seed/lb.

### Phylogen 575WRF

- Full season maturity
- Excellent seedling vigor
- Great yield potential
- Excellent choice for irrigated conditions
- Tall - PGR management required
- Smooth leaf
- Excellent fiber quality package
- Performed well under irrigation in Rio Grande Valley and Winter Garden

### Stoneville 4946GLB2

- Early-mid maturity
- Dual tolerance to Liberty® and glyphosate herbicides
- Root-knot nematode tolerant
- Moderately-aggressive growth habits
- Broadly adapted across all cotton growing regions

### Stoneville 6448GLB2

- Full season maturity
- Dual tolerance to Liberty® and glyphosate herbicides
- Excellent seedling vigor
- Well-suited for dryland and irrigated production

**Table 1. Trial location, cooperator, planting date, harvest date, row spacing, plot dimensions and area of 2013 Texas A&M AgriLife Extension RACE Trials harvested.**

County	Cooperator	Planting Date	Harvest Date	Row Spacing (inches)	Plot Dimensions	Irrigated or Dryland	Area harvested/plot (acres)
